

LS2 Inventory is the industry's most user-friendly shelf management solution in the marketplace.

Integrated directly into TLC's award-winning LS2 Cataloging ecosystem, this web-based tool is built for a library's staff to quickly move through the inventory process without sacrificing details or statistics in the process.

Using LS2 Inventory, all tasks happen within a closed-loop, meaning all inventory related information is enclosed within the module from where it begins, to a new, convenient, final review feature.

LS2 Inventory provides staff members with a "progress bar," giving users a visual estimate of their progress through a collection being inventoried.

Users are always able to identify other inventories currently being performed in the system and which user is conducting them.

Alerts provide users feedback in real-time when material scanned has a system status other than "available."

Safeguards are in place to ensure status changes are accurate and based on library preference.

LS2 Inventory also empowers RFID-enabled library systems to utilize an RFID inventory tool, such as Tech Logic's award-winning CircTRAK shelf management wand, to process a collection faster and more efficiently. With this RFID-via-SIP compatible Shelf Management functionality...

- items are mass-scanned by the swipe of the RFID scanner
- LS2 Inventory provides a workspace for the designated scanner software to identify any items with a status other than "Available."
- any item scanned, regardless of item status, will be updated with a new "inventoried date."
